

Medical Surveillance Plan

Sample document. Illustrative layout for a fictional manufacturing operation.

SAMPLE

This is a sample, not a Plan. The company, roles and exposure levels below are invented to show you the shape of what you will receive. Your own Plan is built from your assessment, checked against the regulatory framework for your industry, and signed off by a registered Occupational Medical Practitioner before release.

Client Example Metals (Pty) Ltd (fictional)
Industry Manufacturing: metals fabrication
Site Single fabrication workshop, day and night shifts
Revision Rev 0 (sample)
Status Illustrative. Not reviewed, not signed, not for use

1. Purpose and scope

This Plan sets out, per job category, which occupational medical assessments are required, how often they recur, and the legal instrument that requires them. It covers all employees and contractors performing the listed roles at the site named above.

2. Legal basis

- Occupational Health and Safety Act 85 of 1993, and the regulations made under it
- Noise-Induced Hearing Loss Regulations, 2003
- Regulations for Hazardous Chemical Agents, 2021
- Driven Machinery Regulations, 2015 (lifting machine operators)
- Basic Conditions of Employment Act 75 of 1997, section 17 (night work)
- Health Professions Council of South Africa guidance on occupational health practice

3. Surveillance schedule by job category

Job category	Principal exposures	Medical protocols	Interval
Welder 4 employees	Welding fume, noise above the action level, UV radiation, manual handling	Spirometry; respiratory symptom questionnaire; audiometry; vision screening with UV skin surveillance; musculoskeletal screen	Baseline, then every 12 months. Exit examination on leaving the role
Overhead crane operator 2 employees	Lifting machine operation, working at height, noise	Lifting machine operator certificate of fitness; heights medical with vertigo and balance screen; audiometry	Baseline, then every 12 months. Exit examination on leaving the role
Paint shop operator 3 employees	Solvent vapours, isocyanates, skin contact	Occupational chemical exposure medical assessment; spirometry; dermatological screen; biological monitoring where the measured exposure requires it	Baseline, then every 12 months, tightened to 6 months where measured exposure exceeds the limit
Night shift stores controller 1 employee	Night work, forklift operation, manual handling	Night work medical examination; lifting machine operator certificate of fitness; musculoskeletal screen	Baseline, then every 12 months. Exit examination on leaving the role

Job category	Principal exposures	Medical protocols	Interval
Office administrator 2 employees	Workstation use, low physical demand	Musculoskeletal and ergonomic assessment; vision screening	Baseline, then every 24 months where no other exposure applies

Intervals never exceed 12 months unless the governing instrument itself allows longer. Where a measurement exceeds a legal limit, surveillance tightens. It never loosens by assumption.

4. How the Plan is kept current

1. Revisions are issued when operations, processes, headcount or the law change.
2. Every revision carries a revision number and is reviewed by the Occupational Medical Practitioner before release.
3. The approved Plan is hosted securely with revision control, and superseded versions are retained.

5. Review and sign off

Care Net screens fitness for work; we do not diagnose. Findings and referrals rest with the reviewing Occupational Medical Practitioner. The employer is the payer, in line with HPCSA guidance.
